Perinatal Mental Health Toolkit Overview & Primer
for Pediatric Primary Care Providers

DC Collaborative for Mental Health in Pediatric Primary Care

Overview

The DC Collaborative for Mental Health in Pediatric Primary Care (the Collaborative) is a local public-private partnership dedicated to improving the integration of mental health in pediatric primary care for children in the District of Columbia. The Collaborative is particularly focused on supporting pediatric primary care providers (PPCPs) in the promotion of mental health among their youngest patients and those patients’ families, which includes perinatal mental health. The Collaborative supports PPCPs in screening for perinatal mood and anxiety disorders, such as postpartum depression, during well-child visits in the first year postpartum, and has created a Perinatal Mental Health Toolkit to aid PPCPs in this important work. The toolkit includes:

1) Summary of Mood and Anxiety Disorders During Pregnancy and Postpartum
2) Edinburgh Postnatal Depression Scale (English, Spanish and compendium of other translations)
3) Screening & Referral Algorithm and Crisis Action Plan for the Edinburgh Postnatal Depression Scale
4) Key Clinical Considerations in the Perinatal Period
5) Perinatal Mental Health Community Resources

Why is postpartum depression important to pediatric providers?

Perinatal mood and anxiety disorders (PMADs) affect between 10 – 20% of women, with even higher rates for low-income women. PMADs are one of the most common, yet underdiagnosed, complications of pregnancy and childbirth in America. They lead to increased costs of medical care, inappropriate medical care, child abuse and neglect, discontinuation of breastfeeding, family dysfunction, and adverse effects on early brain development. Birth outcomes can be negatively affected by PMADs in pregnancy, and PMADs can have a long-term impact on child outcomes. PMADs are associated with attachment insecurity, difficult infant/childhood temperament, developmental delay, and impaired language development. Treatment of maternal depression until remission is associated with decreased psychiatric symptoms and improved functioning outcomes among offspring. Despite the profound negative effects on mother and child, some of which improve with treatment, the vast majority of women with PMADs go untreated.

What is known about PMAD screening in pediatric settings?

Most perinatal care or obstetrical settings only see women at the 4-6 week postpartum visit, and only a minority screen for PMADs. Pediatricians may be the only medical provider many mothers see during the child’s first year of life. PMADs can be identified in pediatric settings during the first postpartum year. Training pediatric providers to detect and address PMADs can enhance pediatric providers’ impact on maternal mental health, carrying the potential to have a trans-generational impact.

Can I bill for screening?

If you are using the Edinburgh Postnatal Depression Scale and the child is insured through a DC Medicaid Managed Care Organization or DC Medicaid Fee-for-Service, you can bill using 96110 and receive reimbursement. For other screening tools and insurances, please consult the infant’s insurer.
When an infant is the patient

Well-child visits provide an ideal opportunity to detect and address PMADs. As pediatric providers are most often not providing primary care to mothers, their main role is one of screening and referral. The Collaborative recommends screening at the following well-child visits (and at other times if indicated):

- 2 month visit
- 6 month visit
- 12 month visit

The Edinburgh Postnatal Depression Scale (EPDS) Pediatric Screening & Referral Algorithm included in this toolkit offers guidelines for administering and responding to a screen. Even for those not screening positive (score of 13 or above), education and potential referrals for support and/or treatment may be indicated.

For all parents with a positive screen:

- If the parent is already in mental health treatment, refer to/notify (with consent) parent’s provider.
- Give parent information and/or referral about community mental health resources.
- Refer to/notify* (with consent) parent’s PCP and/or OB/GYN for monitoring and follow-up. Consider scheduling brief follow-up visit for infant and parent in pediatric office.
- Assess for natural supports and encourage parent to utilize them. Most likely you will have only one parent in the office when a screen is positive. A depressed parent who is alone or feeling alone is at higher risk for suicide. It is important for someone else in the parent’s life to be aware of the presence of depression and be able to step in to help.
- If pediatric providers have clinical questions, they should call DC Mental Health Access in Pediatrics (DC MAP) at 1-844-30DCMAP. Information about DC MAP is available at www.dcmap.org.
- Assess if there is an acute crisis or safety concern. If there is a crisis or safety concern, refer to Crisis Action Plan or parent’s local Emergency Services.

The Collaborative recommends that pediatric providers document the screening result in the medical record as you would with other risk factors that may affect the child health such as substance use or domestic violence. The Collaborative also recommends that pediatric practices continue to use their current strategies for appropriately documenting potentially sensitive family information.

When a pregnant/postpartum young mother is the patient

The Collaborative recommends that pediatric providers caring for pregnant teens or postpartum young mothers screen for perinatal mood and anxiety disorders during pregnancy and in the postpartum period. Questions that arise specific to mental health concerns during screening and/or providing care for a pregnant teen or postpartum young mother should be directed to DC MAP at 1-844-30DCMAP.

Antidepressant medications and lactation

Considerations for lactating women:

- SSRIs (and some other antidepressants) are considered a reasonable treatment option during breastfeeding.
- Most psychiatric medications are passed into breast milk, though in very low amounts.
- When antidepressants are indicated, the benefits of breastfeeding while taking antidepressants generally outweigh the risks. The benefits of other psychiatric medications, including benzodiazepines,
antiepileptics, stimulants, and antipsychotics, may outweigh the risks of the medication during breastfeeding.

- It is important to consider the risk of untreated illness to the mother-baby dyad and balance this with the risk of medication use during breastfeeding.
- It is crucial that evaluation of the risks and benefits of medication use during breastfeeding is done on a patient-by-patient basis and considers the needs of the family.
- Recommendations are ideally made collaboratively with well-informed patients and family members.
- Monitor for side effects in nursing infants.

We also recommend the NIH website LactMed (http://toxnet.nlm.nih.gov/newtoxnet/lactmed.htm), which contains information on medications to which breastfeeding mothers may be exposed.

**Community Resources**

A variety of community resources exist, from support groups to psychiatric treatment for mothers suffering from a perinatal mood and anxiety disorder.

- Resources can be found in the Perinatal Mental Health section of the Collaborative’s Child and Adolescent Mental Health Resource Guide at http://dchealthcheck.net/resources/healthcheck/mental-health-guide.html or in the Perinatal Mental Health Community Resources section of this toolkit.

**Home Visiting Programs**

Home visiting is an early childhood intervention that supports pregnant women and parents/caregivers in their role of raising children by bringing services to them in their natural setting: their home. The models provide visits for families on a weekly or monthly schedule. Home visitors utilize various screening tools to link families to needed community resources. Additionally, home visitors implement evidence-based programs that have been proven to help prevent child abuse and neglect, encourage positive parenting, and promote child development and school readiness. The District of Columbia offers these voluntary, family-focused home visiting services to expecting or new families with infants and children, which are delivered by trained home visiting professionals or paraprofessionals.

For more information about home visiting services, please see the Early Childhood section of the DC Collaborative Child and Adolescent Mental Health Resource Guide at http://dchealthcheck.net/resources/healthcheck/mental-health-guide.html or the DC Home Visiting Council at http://www.dchomevisiting.org/about/

You may also contact the following based on the age of the child:

- For home visiting referrals for prenatal up to age 2 of the baby contact: Fernanda Ruiz at 202-420-7178 or Mia Morrison at 202-302-6669.
- For home visiting referrals for ages 3 – 5 contact: Katherine Rosas at 202-265-0149.

We would like to give special thanks to MCPAP for Moms for allowing us to use and adapt items from their Toolkit for Pediatric Providers available at https://www.mcpapformoms.org/

### Summary of Mood and Anxiety Disorders During Pregnancy and the Postpartum Period (PMADs)

**NOTE about “The Baby Blues”:** This is a temporary and common experience after childbirth, with peak onset 3-5 days after delivery and a maximum duration of two weeks. Features symptoms such as mood swings and excessive worry also seen in many PMADs. Can be a risk factor but is not a determinant for a PMAD and occurs in 80% of new mothers. Usually resolves naturally, though outside intervention such as a peer support group can be helpful.

<table>
<thead>
<tr>
<th>Disorder:</th>
<th>Perinatal Depression</th>
<th>Perinatal Anxiety</th>
<th>Obsessive-Compulsive Disorder (OCD)</th>
<th>Posttraumatic Stress Disorder (PTSD)</th>
<th>Postpartum Psychosis</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>What is it?</strong></td>
<td>Depressive episode that occurs during pregnancy or within a year of giving birth.</td>
<td>A range of anxiety disorders, including generalized anxiety, panic disorder and/or social anxiety, experienced during pregnancy or the postpartum period.</td>
<td>Intrusive repetitive thoughts that are scary and do not make sense to mother(expectant mother). Compulsions (e.g., counting, hand washing) may or may not be present.</td>
<td>Specific anxiety symptoms, including nightmares, flashbacks, and hyper-vigilance, experienced after traumatic event(s), including a traumatic birth.</td>
<td>Sudden onset of psychotic symptoms following childbirth, in particular delusions regarding self and/or child(ren). Increased risk with bipolar disorder.</td>
</tr>
<tr>
<td><strong>When does it start?</strong></td>
<td>Onset can be anytime during pregnancy or first year postpartum. Peaks at 3-4 months. Can be triggered by weaning and/or when menstrual cycle resumes.</td>
<td></td>
<td></td>
<td>Onset between 2 – 12 weeks after delivery. Watch carefully if sleep deprived for ≥48 hours.</td>
<td></td>
</tr>
</tbody>
</table>
| **Risk factors** | - History of perinatal mood/anxiety disorder  
- Personal history of depression or anxiety  
- Family history of depression or anxiety  
- Recent, big life changes (in addition to pregnancy/new baby)  
- Lack of social support  
- Poor marital/partner relationship  
- Multiples  
- Difficult pregnancy  
- Difficult infant temperament (colic, fussy) or related problems (sleep, feeding)  
- Special needs/NICU baby  
- Prior pregnancy or infant loss  
- Infertility treatments  
Dysregulated baby-crying feeding, sleep problems. | | Risk factors for Depression, Anxiety, and OCD, plus:  
- Traumatic birth (in experience of mother) and/or  
- Previous sexual trauma | Bipolar disorder, history of psychosis, history of postpartum psychosis (80% will relapse), family history of psychotic illness, severe sleep deprivation, medication discontinuation for bipolar disorder (especially when done quickly). |
<p>| <strong>What happens?</strong> | Change in appetite, sleep, energy, motivation, concentration. Negative thinking including guilt, hopelessness, helplessness, and worthlessness. May also experience suicidal thoughts and evolution of psychotic symptoms. | Fear and anxiety, panic attacks, shortness of breath, rapid pulse, dizziness, chest or stomach pains, fear of detachment/doom, fear of going crazy or dying. Excessive sometimes debilitating worry. May have intrusive thoughts (see OCD). | Disturbing repetitive thoughts (which may include harming baby or harm coming to baby), adapting compulsive behavior to prevent baby from being harmed (secondary to obsessional thoughts about harming baby that scare women). | Change in cognition, mood, arousal associated with traumatic event(s) and avoidance of stimuli associated with traumatic event. | Mood fluctuation, confusion, marked cognitive impairment. Bizarre behavior, insomnia, visual and auditory hallucinations. May have moments of lucidity. May include altruistic delusions about infanticide and/or homicide and/or suicide. |</p>

</table>
| Resources and treatment         | For depression, anxiety, PTSD and OCD:  
• Self-Care: Exercise, Sleep, Nutrition, Time off from childcare  
• Peer Support Groups  
• Psychotherapy (Individual, Dyadic [mother-baby], Couples, Family)  
• Medication  
Additional complementary and alternative therapies options for depression include bright light therapy, Omega-3, fatty acids, acupuncture and folate. | Requires immediate psychiatric help.  
• Hospitalization and medication are usually indicated.  
• If history of postpartum psychosis, preventative treatment is needed in subsequent pregnancies.  
• Encourage sleep hygiene for prevention (e.g. consistent sleep/wake times, help with feedings at night). |

Edinburgh Postnatal Depression Scale$^1$ (EPDS)

Name: ______________________________ Address: ______________________________

Your Date of Birth: ____________________ Phone: ____________________________

Baby’s Date of Birth: ___________________

As you are pregnant or have recently had a baby, we would like to know how you are feeling. Please check the answer that comes closest to how you have felt IN THE PAST 7 DAYS, not just how you feel today.

Here is an example, already completed.

I have felt happy:

☐ Yes, all the time
☒ Yes, most of the time This would mean: “I have felt happy most of the time” during the past week.
☐ No, not very often Please complete the other questions in the same way.
☐ No, not at all

In the past 7 days:

1. I have been able to laugh and see the funny side of things
   ☐ As much as I always could
   ☐ Not quite so much now
   ☒ Definitely not so much now
   ☐ Not at all

2. I have looked forward with enjoyment to things
   ☐ As much as I ever did
   ☐ Rather less than I used to
   ☒ Definitely less than I used to
   ☐ Hardly at all

3. I have blamed myself unnecessarily when things went wrong
   ☐ Yes, most of the time
   ☒ Yes, some of the time
   ☐ Not very often
   ☐ No, never

4. I have been anxious or worried for no good reason
   ☐ No, not at all
   ☒ Hardly ever
   ☒ Yes, sometimes
   ☐ Yes, very often

5. I have felt scared or panicky for no very good reason
   ☒ Yes, quite a lot
   ☒ Yes, sometimes
   ☐ No, not much
   ☐ No, not at all

6. Things have been getting on top of me
   ☐ Yes, most of the time I haven’t been able to cope at all
   ☒ Yes, sometimes I haven’t been coping as well as usual
   ☐ No, most of the time I have coped quite well
   ☐ No, I have been coping as well as ever

7. I have been so unhappy that I have had difficulty sleeping
   ☐ Yes, most of the time
   ☒ Yes, sometimes
   ☐ Not very often
   ☒ Yes, quite often
   ☐ No, not at all

8. I have felt sad or miserable
   ☐ Yes, most of the time
   ☒ Yes, quite often
   ☐ Not very often
   ☒ No, not at all

9. I have been so unhappy that I have been crying
   ☐ Yes, most of the time
   ☒ Yes, quite often
   ☐ Only occasionally
   ☒ No, never

10. The thought of harming myself has occurred to me
    ☒ Yes, quite often
    ☒ Sometimes
    ☐ Hardly ever
    ☐ Never

Edinburgh Postnatal Depression Scale\(^1\) (EPDS)

Postpartum depression is the most common complication of childbearing.\(^2\) The 10-question Edinburgh Postnatal Depression Scale (EPDS) is a valuable and efficient way of identifying patients at risk for "perinatal" depression. The EPDS is easy to administer and has proven to be an effective screening tool.

Mothers who score above 13 are likely to be suffering from a depressive illness of varying severity. The EPDS score should not override clinical judgment. A careful clinical assessment should be carried out to confirm the diagnosis. The scale indicates how the mother has felt *during the previous week*. In doubtful cases it may be useful to repeat the tool after 2 weeks. The scale will not detect mothers with anxiety neuroses, phobias or personality disorders.

Women with postpartum depression need not feel alone. They may find useful information on the web sites of the National Women’s Health Information Center \(<\text{www.4women.gov}\>\) and from groups such as Postpartum Support International \(<\text{www.chss.iup.edu/postpartum}\>\) and Depression after Delivery \(<\text{www.depressionafterdelivery.com}\>\).

### SCORING

**QUESTIONS 1, 2, & 4 (without an *)**

Are scored 0, 1, 2 or 3 with top box scored as 0 and the bottom box scored as 3.

**QUESTIONS 3, 5-10 (marked with an *)**

Are reverse scored, with the top box scored as a 3 and the bottom box scored as 0.

- Maximum score: 30
- Possible Depression: 10 or greater
- Always look at item 10 (suicidal thoughts)

Users may reproduce the scale without further permission, providing they respect copyright by quoting the names of the authors, the title, and the source of the paper in all reproduced copies.

### Instructions for using the Edinburgh Postnatal Depression Scale:

1. The mother is asked to check the response that comes closest to how she has been feeling in the previous 7 days.

2. All the items must be completed.

3. Care should be taken to avoid the possibility of the mother discussing her answers with others. (Answers come from the mother or pregnant woman.)

4. The mother should complete the scale herself, unless she has limited English or has difficulty with reading.

</tbody>
</table>

6. Las cosas me oprimen o agobian:
   - Sí, la mayor parte del tiempo no he podido sobrellevarlas ☑ 3
   - Sí, a veces no he podido sobrellevarlas de la manera 2
   - No, la mayoría de las veces he podido sobrellevarlas bastante bien 1
   - No, he podido sobrellevarlas tan bien como lo hecho siempre 0

7. Me he sentido tan infeliz, que he tenido dificultad para dormir:
   - Sí, casi siempre ☑ 3
   - Sí, a veces 2
   - No muy a menudo 1
   - No, en absoluto 0

8. Me he sentido triste y desgraciada:
   - Sí, casi siempre ☑ 3
   - Sí, bastante a menudo 2
   - No muy a menudo 1
   - No, en absoluto 0

9. Me he sentido tan infeliz que he estado llorando:
   - Sí, bastante a menudo ☑ 3
   - A veces 2
   - Casí nunca 1
   - No, nunca 0

10. He pensado en hacerme daño:
    - A veces ☑ 3

ABOUT THE EPDS

Response categories are scored 0, 1, 2 and 3 according to increased severity of the symptom. Items 3, 5-10 are reverse scored (i.e., 3, 2, 1, and 0). The total score is calculated by adding together the scores for each of the ten items. Users may reproduce the scale without further permission providing they respect copyright (which remains with the British Journal of Psychiatry) quoting the names of the authors, the title and the source of the paper in all reproduced copies.

The Edinburgh Postnatal Depression Scale (EPDS) was developed to assist primary care health professionals in detecting mothers suffering from postpartum depression (PPD); a distressing disorder more prolonged than the “blues” (which occur in the first week after delivery), but less severe than puerperal psychosis.

Previous studies have shown that PPD affects at least 10 percent of women and that many depressed mothers remain untreated. These mothers may cope with their baby and with household tasks, but their enjoyment of life is seriously affected and it is possible that there are long term effects on the family.

The EPDS was developed at health centers in Livingston and Edinburgh. It consists of 10 short statements. The mother underlines which of the four possible responses is closest to how she has been feeling during the past week. Most mothers complete the scale without difficulty in less than five minutes.

The validation study showed that mothers who scored above a threshold 12/13 were likely to be suffering from a depressive illness of varying severity. Nevertheless, the EPDS score should not override clinical judgement. A careful clinical assessment should be carried out to confirm the diagnosis. The scale indicates how the mother felt during the previous week, and in doubtful cases it may be usefully repeated after two weeks. The scale will not detect mothers with anxiety neuroses, phobias or personality disorders.

INSTRUCTIONS FOR USERS

1. The mother is asked to underline the response that comes closest to how she has felt during the previous seven days.
2. All 10 items must be completed.
3. Care should be taken to avoid the possibility of the mother discussing her answers with others.
4. The mother should complete the scale herself, unless she has limited English or has difficulty with reading.
5. The EPDS may be used at six to eight weeks to screen postnatal women or during pregnancy. The child health clinic, postpartum check-up or a home visit may provide suitable opportunities for its completion.

Edinburgh Postnatal Depression Scale (EPDS) Scoring & Other Information

Cox, J. L., Holden, J. M., & Sagovsky, R. (1987). Detection of postnatal depression: Development of the 10-item Edinburgh Postnatal Depression Scale. British Journal of Psychiatry, 150, 782-786. The Spanish version was developed at the University of Iowa based on earlier Spanish versions of the instrument. For further information, please contact Michael W. O’Hara, Department of Psychology, University of Iowa, Iowa City, IA 52245, e-mail: mikeohara@uiowa.edu.
Edinburgh Postnatal Depression Scale Screening & Referral Algorithm for Pediatric Primary Care Providers During Well-Child Visits

Explain the screen
Feeling depressed or anxious is very common during pregnancy and/or after birth. 1 in 7 women experience depression, anxiety or frightening thoughts during this time. It is important that we screen for depression because it is twice as common as diabetes. It can also impact your and your baby’s health. We will be seeing you and your baby a lot over the next few months/years and we want to support you.

Score of 0-9: Normal/Negative Screen (likely not suffering at this time)
- Provide education about risks/incidence.
- Use clinical judgment regardless of score.
- Provide Postpartum Support DC contact for support groups and other community resources: 202-643-7290
- Suggested language: From the screen, it seems like you are doing well. Having a baby is always challenging and every parent deserves support. Do you have any concerns you would like to talk to us about? In the future, should you start to have a difficult time or develop depression or anxiety, please follow-up with your doctor or talk to me about it at your child’s next visit.

Score of 10-12: At-Risk for Depression and/or Anxiety
- Discuss results and provide education.
- Strongly consider making referral and/or providing Postpartum Support DC number: 202-643-7290
- Suggested language: Based on what you’ve told me and your score, I am concerned that you may be having a difficult time or be depressed. It can be hard to feel this way when you have a baby/young child. There are things you can do to feel better. Let’s talk about some ideas that might work for you.

Score of 13+: Positive Screen (likely suffering from Depression and/or Anxiety)
- Discuss results and provide education.
- Make referral and/or give Postpartum Support DC number: 202-643-7290
- Suggested language: Based on what you’ve told me and your score, I am concerned that you may be depressed. What you are feeling is real and it is not your fault. It can be very hard to feel this way when you have a baby/young child. Getting help is the best thing you can do for you and your baby. Many effective support and treatment options are available. Let’s talk about some ideas that might work for you.

QUESTION #10 (SELF-HARM):
If “Yes” – Hardly ever, Sometimes, or Yes, quite often – MOVE TO CRISIS ACTION PLAN

Source: Adapted from Massachusetts Child Psychiatry Access Project for Moms’ Postpartum Depression Screening Algorithm for Pediatric Providers During Well-Child Visits, available at www.mcpapformoms.org
CRISIS ACTION PLAN

Patient answers "YES" to #10 on EPDS or
Patient reports thoughts of harm to self or others

Ask further Questions:

• **Intent:** You have said that you think about killing or harming yourself. Have you made any plans?
• **Means:** Can you describe your plans? or How have you thought about killing yourself (your infant)? Do you have access to [stated method]?
• **Likelihood:** Do you think you would actually harm or kill yourself or someone else?
• **Protective Factor:** What is keeping you from following through with your plan?
• **Impulsivity:** Have you tried to harm yourself or someone else in the past?

If patient has a plan and provider or patient feels she cannot be safe then follow the next steps:

• Do not leave patient by herself or alone with baby
• Ask patient about supportive person in their life (husband, parent, friend)
• Request permission to make this person aware of current circumstances
• Engage them to plan for: child care, transportation to emergency services, emotional support

Coordinate immediate psychiatric/crisis intervention or evaluation

• Be familiar with Emergency Department policies and referral processes
• When no resources are available, call 911 (ask for Crisis Intervention Officer if available)

If patient is NOT in the office and feels she CANNOT be safe or worries if she will be safe then follow the next steps:

• Ask where she is and if she is alone
• Assess degree of risk, as above
• Arrange for immediate psychiatric/crisis intervention or evaluation while patient remains on phone
• Assess availability and proximity of resources and support

Source: Adapted from Crisis Action Plan discussed at "Transforming Science into Strategy: A Multidisciplinary Model for Perinatal Mood Disorder Screening" presentation by Alison Palmer at PSI Conference 2013
# Key Clinical Considerations When Assessing the Mental Health of Pregnant and Postpartum Women

## Assessing Thoughts of Harming Baby

<table>
<thead>
<tr>
<th>Thoughts of Harming Baby that Occur Secondary to Obsessions/Anxiety</th>
<th>Thoughts of Harming Baby that Occur Secondary to Postpartum Psychosis</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Good insight</td>
<td>• Poor insight</td>
</tr>
<tr>
<td>• No psychotic symptoms</td>
<td>• Symptoms of psychosis (eg. auditory and/or visual hallucinations)</td>
</tr>
<tr>
<td>• Thoughts are intrusive, scary, and cause mother anxiety</td>
<td>• Delusional beliefs with distortion of reality present</td>
</tr>
<tr>
<td>• Ego-dystonic</td>
<td>• Ego-syntonic</td>
</tr>
</tbody>
</table>

*Suggests NOT a risk of harming baby*  
*Suggests AT RISK of harming baby*

## Medication May Not be Indicated

<table>
<thead>
<tr>
<th>Medication May Not be Indicated</th>
<th>Medication Treatment Should be Considered</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Mild depression based on clinical assessment</td>
<td>• Moderate or severe depression based on clinical assessment</td>
</tr>
<tr>
<td>• No suicidal ideation</td>
<td>• Suicidal ideation</td>
</tr>
<tr>
<td>• Able to care for self/baby</td>
<td>• Difficulty functioning caring for self/baby</td>
</tr>
<tr>
<td>• Engaged in psycho-therapy or other non-medication treatment</td>
<td>• Psychotic symptoms present</td>
</tr>
<tr>
<td>• Depression has improved with psychotherapy in the past</td>
<td>• History of severe depression and/or suicidal ideation and/or attempts</td>
</tr>
<tr>
<td>• Strong preference for and access to psychotherapy</td>
<td>• Comorbid anxiety diagnosis or symptoms</td>
</tr>
</tbody>
</table>

## Risk Factors for Postpartum Depression

- Personal history of anxiety disorder, major depression and/or postpartum depression
- Family history of mood or anxiety disorder
- Difficulty breastfeeding
- Fetal/Newborn loss
- Lack of personal or community resources
- Financial challenges
- Complications of pregnancy, labor/delivery, or infant’s health
- Teen pregnancy
- Unplanned pregnancy
- Major life stressors
- Violent or abusive relationship
- Isolation from family or friends; lack of social support
- Substance use/addiction

## Other Considerations During Clinical Assessment

- Past history of psychiatric diagnosis
- Previous experience with counseling or psychotherapy
- Previous psychiatric medication
- History of other psychiatric treatments such as support groups
- History of substance use or substance use treatment
- Excessive anxiety and worry
- Trauma history
- Domestic Violence

## How to Talk about Perinatal Depression and Anxiety with Moms

- *How are you feeling about being pregnant/being a mother?*
- *What things are you most happy about?*
- *What things are you most concerned about?*
- *Do you have anyone you can talk to that you trust?*
- *How is your partner doing?*
- *Are you able to enjoy your baby?*

- **Bus:** 90, 93, 96, X3, S1, S2, S4, S9
- **Contacts:**
  - For perinatal-specific MH needs,
    Lynne McIntyre,
    Manager, MMH Program
    P: 202-545-2061
    lm McIntyre@maryscenter.org
  - For general MH needs, including Peds:
    Cindy Flores,
    Senior Program Assistant
    202-420-7122
    cflores@maryscenter.org
  - [http://www.maryscenter.org/mental-health](http://www.maryscenter.org/mental-health)

**Services Offered:**
- Outpatient psychotherapy and psychiatry
- Reproductive mental health specialists on staff for individual therapy.
- Support & education groups offered in both Spanish & English; contact for details and referrals

**Languages:** Spanish

**Insurance:** Medicare, Medicaid, and all Medicaid MCOs in DC accepted; also uninsured DC residents.

**Availability:** Generally 1-2 weeks for PMH services; sometimes longer for general MH services.

**Referral:** No referral necessary.

### MedStar Georgetown University Hospital – Perinatal Mental Health Clinic

- **Address:** 2115 Wisconsin Avenue Suite 200, WDC 20007
- **Bus:** 30N, 30S, 31, 33
- **P:** 202-944-5400 for appointments

**Services Offered:**
- Offers outpatient evaluation and treatment of psychiatric disorders and adjustment problems experienced by women who are transitioning into motherhood. Provide diagnostic evaluations and multidisciplinary treatment for women experiencing mood and anxiety disorders during pregnancy and postpartum, infertility-related distress, pregnancy loss, and difficulty with the transition

**Insurance:** Most major private insurance and MedStar Family Choice (DC MCO).

**Referral:** No referral necessary.
Director: Aimee Danielson, PhD. Providers may call Dr. Danielson directly with questions at 202-944-5412.

- In cases where psychiatric medication is necessary, psychiatrists with expertise in use of medication in pregnant and lactating women are available.
- Reproductive psychiatrists on staff, as well as residents in training, and part-time therapists who specialize in perinatal mental health.
- Services are generally time-limited for 1 year postpartum (may be longer dependent on when woman is diagnosed)
